□ **Carolina Isfer** started transcription

Carolina Isfer 0:03

I sent you as part of the invite a link to a Miro board which we will be using for the discussions today. But before that I just want to introduce somebody, a new face into the this group which you may some of you may not have worked with before. So Clemens and Martin and Michael, we have Tim with us today. Tim, yes, so Tim will be providing support to SEFE project from the new year.

Michael Lemke 0:27

But no faith.

Tim Grubbart 0:36

OK.

Carolina Isfer 0:37

And we have heard your feedback in terms of improving communications and all of that. So Tim's role is to sit in between design and development, so to say and and support with that communication layer. So Tim, you want to?

Tim Grubbart 0:45

I.

Carolina Isfer 0:57

Talk a bit about you and.
Rowan, he's in the car.

Tim Grubbart 1:01

One is saying hi with the camera for a second. Yeah, yeah. Hi, I'm Tim. I'm a customer experience lead and a matching director at UDG and I'm going to join the project to help out with the effort.

Caro basically said like translating the between design and the development layer. And yeah, I've been basically doing that for the last 20 years or something. I I I started as a UX designer I've.

Program myself. I've tried to design interface myself, although they might have been pretty. I was always painfully slow doing that. And yeah, no, I'm here. I'm happy to help.

Carolina Isfer 1:50

All right. So today mostly Tim will be listening because he's in the car, but I want him to just be onboarded into all things related to the project. So Tim has been onboarded previously. I had a meeting with him, gave him an update on all things about the project. So Michael is our.

Project Master Brain in in running things from surface side together with Mina and from the creative brains we have then Martin and Clemens.

Clemens Lango 2:25

Hi, yeah. Plus we also plan to extend the team in some areas. So on one side for the refinement topic, we also included Sebastian, our technical head off to be also looking into things and.

Tim Grubbert 2:28

Thank you.

Clemens Lango 2:45

Discussing testing around if it's if it helps on some end and we also plan to. Bring Rebecca in. She's an experienced UXer in our house and she might also drive the work forward. So we are a bit broader now and we'll see how we how we distribute the tasks when they are there, yeah.

Carolina Isfer 3:10

Wonderful. I see that we're all very well planned then for the year ahead and we have learned a thing or two from the previous year in terms of where we can point to make things better. So I'm, I'm very satisfied to hear that that.

We're all gearing, gearing up to well resourced teams.

So today I would like us to talk about two separate topics. First one being the the

immediate improvements that we are commissioned to do to the current website and second topic being general plan, preliminary planning for release 2. I don't expect.

That we will get to any nitty gritty details about release 2, but there's stuff that can be put in motion and that we should be pre aligning. So we'll cover that in the second-half of the meeting. The first half I want us to cover then improvements. So I'm going to share my screen. Please let me know if you cannot get into the mirror board.

I will. I can share the link again. Let me copy it.

Into the chat.

In case you need it, please let me know if you cannot enter.

All right. So for the improvements, we have three focus topics. We have a general performance improvement approach, we have a scaling concept approach and there is an increased content creation flexibility approach.

For the first two, the the leading force in in championing what's going to happen comes from Cheo and for the third one is mostly UDG.

UDG focused execution. So I see you're having issues joining.

Salvador Camarasa Sola 5:17

Yeah, I tried sites yesterday and I got the message that it would need confirmation to get in, but still cannot log in, so I don't know.

Carolina Isfer 5:27

Can you open an Incognito window and copy paste the link? See if it works.

Salvador Camarasa Sola 5:31

Yes, I I guess so let's try. But I need to create an account. I created an account but looks like it's pending some invitation or something like that, so I'm not sure.

Clemens Lango 5:48

But.

Salvador Camarasa Sola 5:52

No. Are are you also logging with SSO?

Carolina Isfer 5:54

Yes.

No.

Salvador Camarasa Sola 5:57

Then I cannot. Let's try again.

No, it says that it's not associated with any account, so I will try to follow.

Carolina Isfer 6:08

Follow from the screen. Monika, if you could give me support in the background if you need support or anything or Benedict if you have.

Salvador Camarasa Sola 6:08

Without interacting.

CL Clemens Lango 6:15

Mhm.

Carolina Isfer 6:21

All right, so.

First, let's touch then the first cab of the ring, which is performance improvements, right. So as we know, we have a site. So the issue that we have in general is that we it was identified that deliver files and blur effects.

CL Clemens Lango 6:33

Yes.

Carolina Isfer 6:43

Are key causes to the slow performance of the the website pages for all sorts of reasons. We we progressed with them as they are, but they they seem to sit at the core of the sluggishness and loading performance in some pages.

That is not exclusive. There could be other factors, there's there could be other elements that might be interfering, but the investigations that were done up until shortly after launch established that those were.

The key points what we want to achieve is to really optimize the website speed and responsiveness, ensuring smooth user experience. And so we need to look at modifications to do to be done to the graphics somehow in one way or another that that reduces this loading time.

And performance and creates performance improvements more so because we're going to be bringing sales and storage in and the performance in terms of a sales interface needs to be much, much, much better.

 **Clemens Lango** 7:57
2.

 **Carolina Isfer** 7:58
So there is a there's certainly more aggressive KPIs in that front and if we're going to be using same module, same visuals, same everything, we we need to have them right. So my idea for this preliminary session or the session today is that we explore together what what can be done.
What ideas that we may have, things that to you might have have looked at, any technical things that we might have looked at as well and then just go 1 by 1 pros and cons try to get to.

 **Clemens Lango** 8:20
2.

 **Carolina Isfer** 8:32
An angle that would solve not only the design challenges to to make it continue look as as amazing as it is, but also that it doesn't bring any additional technical difficulties in implementation and cover any limitations.
Is that okay for everybody?

 **Clemens Lango** 8:55
Yeah.

 **Carolina Isfer** 8:56
So Clemens and Martin, so the initial ideas that we had and here I'm talking then the the stages which and footer which have the the Viva files were.

To perhaps substitute them and approach that with video like we did for the homepage. That would be one alternative. I don't know. Have you looked into any of these or have you got any other ideas for how the stages could have the?

 **Clemens Lango** 9:30
Mm.

 **Carolina Isfer** 9:31
Erformance imroved in that sense.

 **Clemens Lango** 9:34
Yeah, maybe. May I ask one question? What? What are the main page classes that have severe performance issues? I always thought it's the home page.

 **Benedikt Eger** 9:47
OK.

 **Michael Lemke** 9:49
No, all of them. It's all all pages are not working properly. So when I walk through the office, people are going on on the website and they constantly asking me is this my computer or is it a website?

 **Clemens Lango** 9:51
Huh.

 **Michael Lemke** 10:04
It's every page.

 **Clemens Lango** 10:06
Mm-hmm.

 10:09
Yep.

 **Clemens Lango** 10:10

Yeah, yeah, of course we have. That's why I asked on the homepage. We already exchanged 2 video files. There we have also an idea which might lead to better performance if we reduce the the pixel dimension of the video files.

That might be worth a test, which we would like to do and see what happens. And on the topic pages, as you said, we still have the right files in the header and potentially the footer. And we could of course do the same procedure like converting them to video files and.

Then then we don't have any more rendering efforts of the browser, at least no more blur, ready and so on, and no rife routine. So this might be a first step and see what happens.

 **Michael Lemke** 10:58

When we touch the footer, we should also take a look on how we can improve this from a graphic standpoint and for short pages. You remember we have this issue with the imprint and and the contact pages where we have smaller pages.

When they're coming closer, we get this edge in the design because of the different layers. So maybe this is something which we take into consideration when we take a look at the footer.

 **Carolina Isfer** 11:31

Yeah.

 **Michael Lemke** 11:33

Can you notice down Carolina on the spot that we don't forget?

 **Carolina Isfer** 11:33

Mhm.

Mhm.

Yep.

Yes. So, so with that in mind in relation to the river files, it also is important to note that that of course when we look at scaling concept that is for the header and stages of all of this.

All pages and there will be a relationship to be explored there when when you change things to videos. Does that help or interfere with how scaling is supposed to work? We can talk about that later.

Other things that we could look at could include perhaps 3D graphics. I don't know is that have we explored that sort of stuff before?

Salvador Camarasa Sola 12:41

Yeah, I will explain explain briefly. Yeah, that was one of the possible approaches we got at the very beginning of the project, which was to use Web GL.

API in order to leverage all the display of these complex graphics like especially the Auroras which have these blur effects etcetera, which would be by far more and more and more performance.

But here we have a few issues. It's that we need to, yeah, we need to program what's the shaders themselves. So that would be we would need a very close collaboration.

Especially with the design team to get the desired effects. But the the drawback is that we don't have all the required expertise, so we are not Web GL experts, so we would need some time in order to.

Learn and and and and and have and get the the the concepts and and be able to to to control 100% what we do. So that's our only yeah well I would say or.

Carolina Isfer 13:59

OK.

Yeah.

A limitation that we have.

Salvador Camarasa Sola 14:07

Yes, actually it's it's. If not it would be already have done this way because nowadays it's quite more performance to to use just use the the the own graphic library and.

Because also we would have, I mean if we wanted to change colors, shapes, it's far more easy. So we don't need to re render videos or to, you know, to recreate all the stuff from scratch, we could just.

Set some parameters and we would achieve different effects. But yes, we lack the the expertise, so we would need some time in order to or find some expert who who could, yeah, at least lead us on the first steps.

Carolina Isfer 14:52

And we can bring in a freelancer or somebody to to just deliver that.

Salvador Camarasa Sola 14:56

In order to to do so. But yeah, for me that would be the the the more performance thing because the process already it's like 10 years ago, sorry, it's something that exists since from 10 years ago and it's very, very consolidated in our browsers for all systems even.

Carolina Isfer 14:57

Mhm.

Salvador Camarasa Sola 15:15

Even slow systems can show up basic 3D graphics because for a for a for a graphic card doing an Aurora which is just a disk with blur, it's easy peasy but not that much with if we have to.

Carolina Isfer 15:29

And.

Salvador Camarasa Sola 15:31

Do other kind of effects like vector graphics with blurs. It's far more less.

Carolina Isfer 15:36

Lemons.

Are you familiar with this technology? Have you designed for this technology before?

CL Clemens Lango 15:44

I know that that QL is a fast, hardly accelerated rendering topic and it's very performant. How we which formats exploit these acceleration I think needs to be investigated. We can generate many formats I think, but we need to find. Find out how things are rendered and handled and then we can surely do a test what happens and I think that's also a good way of working. So just generating code approaches, generating assets. Experimenting variants of things and so finding out what the best way is. I think that's a good way to work.

Carolina Isfer 16:29

Tim, do you have experience with this technology?

Tim Grubbert 16:34

Yes.

Carolina Isfer 16:35

Yes, thank you.

Tim Grubbert 16:37

Yeah.

Carolina Isfer 16:38

All right, so that that is also an option.

Tim Grubbert 16:40

So we can, we can definitely come up with a with a plan to submit the motion.

Carolina Isfer 16:45

M.

OK.

So that that is another alternative. So we have videos, we have these 3D graphics as an alternative and these these would be then for your header, footer, Aurora scenarios, right?

The other options that we were we could consider and these revolve more around the blur effects that are spread throughout all modules. Salva, sorry, yes, do you want to say something?

Salvador Camarasa Sola 17:16

No, I'm actually the the the web geographics would be. So the the idea is or I'm thinking more in the homepage because the homepage has a whole story by itself because the the.

Carolina Isfer 17:27

Mhm.

Salvador Camarasa Sola 17:34

Another thing is that these graphics should go in the very background. You know what I mean? Because we cannot, we could try, but I don't think that maybe we could achieve some transparency because this in the end is drawn. It's what we call a canvas. So this canvas.

Carolina Isfer 17:40

Mhm.

Mhm.

Salvador Camarasa Sola 17:53

I'm not sure if we can make them fully transparent, so I'm not sure if for the footer because the footer and the header has this overlay effects, so I'm not sure here we would apply so maybe would be better to go.

Carolina Isfer 17:59

OK.

Mhm. OK.

Salvador Camarasa Sola 18:08

With other approach because the also the area is smaller so I think performance wise we can move on on footer and header but then for homepage or or the background Aurora in in there are in most pages we could.

Carolina Isfer 18:11

Mhm.

You could look at it, yeah.

Salvador Camarasa Sola 18:25

Maybe use this this web GL approach here, so only that.

Carolina Isfer 18:28

OK. Thank you so much. So yeah, so, so good you mentioned background Aurora. So what we have currently are all these blur effects spread throughout the module. So there there are blurs attached to each module at the the anchors, right we we we have the the.

The blue and green blurs and the blurring makes it complicated for graphic cards, so we did a quick exercise on swapping those for gradients.

Clemens Lango 19:00

Mhm.

Carolina Isfer 19:03

Um on your local testing, local machine testing and and the performance was.

Became a known issue, so clearly the blur causes the problem. Now there are many ways to fix to look at blur. You can look at 3D graphics as background. In general we can look at fixed backgrounds, so you're really going to.

Create a.

Wallpaper, so to say that sits in the background and then and look looks blurry, but it's a it's an image. We can work with gradients of gradient effects instead of blurs.

So I just wanted to understand from Cheo from.

Clemens, what what are your views on on these approaches for blurs in general?

Clemens Lango 19:54

Yeah, we are completely open on the way it is, let's let's say realised. So we just defined the look and we can clearly do variance on the ways of making this look happen. The first approach as far as I understood was HTML defined way was.

First one was no was a blurred blurred circle. The second approach you mentioned would be to just define HTML based gradient and another third approach might be just exporting opaque bitmaps.

From our side and they would again look identically and we can just do a test. I don't know, maybe make a page with let's say 50 circles just for testing purposes. Have one variant as it is, the second one as you described with a gradient in HTML and the third one with.

50 opaque bitmaps and we do just a side by side comparison and I think we'll easily

find out what is our best way to go together, right? So let's just do it. We do some variance and look what happens.

Carolina Isfer 21:01

You touched something important there, Clemens. I really want to approach this as a a proof of concept delineation. So let's look at the performance of each alternative at a minimum.

Minimum viable product interface and then let's set some KPIs and see what what meets what and then we decide on the best one to roll out. Of course, just talking about it doesn't guarantee that we have picked the right one.

Michael, you want to say something?

Michael Lemke 21:36

Yeah, as you remember when we started with this background thing here with the brighter future design, we actually also intended to have this parallax effect. I'm I'm wondering when we, for example, go for a background.

Carolina Isfer 21:49

Mhm.

Michael Lemke 21:53

Maybe this could help us to install this. So there is one background which is more or less fixed to a certain height and then everything else renders in front of it. So you get this kind of effect. So I would like to understand whether not now, but in general whether we could.

Carolina Isfer 22:06

Mhm.

Mhm.

Michael Lemke 22:12

With our improvements also get this parallax effect back on track. So maybe as a side note here that we check which could which approach could help us to bring the parallax back.

Carolina Isfer 22:19

Mhm.

Uh huh.

Michael Lemke 22:29

Not priority #1, but worth exploring because it still may bring some impact on how things feel more dynamic and this was also something which we always wanted to have.

Carolina Isfer 22:42

Mhm.

That is very important. Salva, do you believe that it is possible to work with backgrounds in that manner?

Salvador Camarasa Sola 22:54

I would say so, but from my side I don't have too much experience with this kind of parallax.

Carolina Isfer 23:09

Mhm.

Salvador Camarasa Sola 23:09

Effects. So I I would need to check and document myself, make some tries, but well, actually in in in summary everything would be achievable. Problem is that yeah, we need to.

Michael Lemke 23:23

Priority #1 is speed, right? And when we when we identify the right method for for speed, then the parallax effect is second. So speed is speed is priority #1.

Carolina Isfer 23:26

Mhm.

Salvador Camarasa Sola 23:26

Yes.

Mhm.

Correct.

Carolina Isfer 23:33

OK.

Salvador Camarasa Sola 23:35

Yes, but yeah, we we can. I I I would say, yeah, it can be done, but I cannot give you at this very moment any time estimations or anything like that. So yeah, it could be done, but as as as my.

Carolina Isfer 23:36

OK.

It can be done.

No, and I'm not asking for that. It's more about possibility.

Salvador Camarasa Sola 23:55

As Michael says, yeah, first of first, first thing first, so improve performance and then we can talk about it, yeah.

Carolina Isfer 24:00

Mhm.

OK. Clemens and Martin, do you have any other ideas in your toolkit team as well, if anything else that we can think of?

CL Clemens Lango 24:14

We might do some, yeah. We did not work on this yet, but we can of course think if there's another way. But my assumption is that as soon as we use the park bitmaps. There will be 0 delay of anything and also parallax might be possible because it's no world invention to have a parallax with bitmaps. So that's bread and butter things I would say. So I would assume as soon as we have the park bitmaps there should be.

Carolina Isfer 24:41

Mhm.

CL **Clemens Lango** 24:46

No issue of how many circles we have in there wouldn't. That's my assumption. Yeah, because of course we could do further investigations. There's even another way of doing it. I mean, that's right. We need to investigate.

 **Carolina Isfer** 24:52

Mhm.

CL **Clemens Lango** 25:03

But when I take a look at the page, we have those circles are moving in loops slowly, even though it's videos, right? So I was I was thinking of if there is maybe an option to merge ideas like having the bitmaps and a video file that's above of it, that's just having the glow that moves.

Something like that. This is stuff that we could investigate as well, but as far as I understood, we're currently discussing the the blurred green and blue dots in the background on each section, and they are, yeah, they're static, they're not animated. So let's simply use bitmaps and they also provide the.

 **Carolina Isfer** 25:32

Yep.

CL **Clemens Lango** 25:41

Our lacks effect. Yeah, true. And yeah.

 **Carolina Isfer** 25:46

Yeah. So we're talking those.

CL **Clemens Lango** 25:48

Yeah, yeah, I know. I think it's a bit of processor performance required to calculate the blur and we can skip this by just taking the blur visually in a static bitmap and then that's no issue I think.

 **Carolina Isfer** 25:50

Blue and green, yeah.

Mhm.

Mm-hmm. OK, Saba, do you recall if the the hover blurs like what is being seen here? Do they also interfere with performance?

Salvador Camarasa Sola 26:18

Excuse me, can you ask again? Sorry. No, no, no. This is a this is a vector image. Yeah, well.

Carolina Isfer 26:20

The hover, so so the blur that comes in on hover or that or that's a a static image, right?

Rendered.

Salvador Camarasa Sola 26:33

It does. It does indeed, because as you, I don't know if you can appreciate it, but for at least on my computers, places I've test, the bigger the screen also also depends on the size of the screen. But yes, the performance.

Is a bit, so it's not that a smooth 60 frames per second, you know what I mean? So it's a it slows down a bit. So actually I don't know if it's the frame rate of your video feed or I don't know.

Carolina Isfer 26:57

Mhm.

Salvador Camarasa Sola 27:07

But for me, it's not that smooth, you know what I mean? And especially if if you sorry.

CL Clemens Lango 27:10

What we currently, what we currently see is because of the team's frame rate. I think you test it locally. I never saw any delay of anything, but we kind of truly test it if we maybe first step exchange the background circles.

Salvador Camarasa Sola 27:19

OK.

Carolina Isfer 27:20

Please done.

Clemens Lango 27:29

Then we do a hard test or maybe especially slow computer also and test for example these hogas. If you have the feeling that it's not perfect or fluent enough, then we could again do a round of swapping these.

Into another technology, I think, yeah, but as soon as we have the blurred topic reduced on the background, I think it will be quite a new performance.

Carolina Isfer 27:55

Mhm.

Michael, were you ever, do you have any KPIs or anything that that you have documented somewhere or anything that we should be aiming for or do we just get industry, you know, industry standards so to say?

Michael Lemke 28:17

So you talk about milliseconds or on on frame rate or no, it is, it is, it is that it feels like any other page. I mean it's it's a it's the feeling you have when you go there, right? It's it trickles down.

Carolina Isfer 28:20

Yeah, performance. I can do have any targets.

Mhm.

Michael Lemke 28:33

And it feels like it's not fluent and we don't need to achieve any frame rates or particular KPIs on that. It just need, we just need to create that feeling that there's no issue with the page.

Carolina Isfer 28:43

Mhm.

Michael Lemke 28:49

And if this is below a Ki, then it doesn't matter.

Does this make sense to you?

Carolina Isfer 28:55

Because it makes sense. I'm just, I'm, I'm asking because we're looking at exploring a few alternatives, right? So we can do this way, we can do that way. And yes, we can do many.

Tests, but we should work with some hypothesis to what we think will be the the best cost benefit and implementation, because there are many, many things that can work and we don't have an endless agile budget.

Or we can't just keep proof of concepting it. It also we should pick a target that we want to to set a performance target and see OK, which of the approaches best cost benefit that meets that target on a on a proof of concept and then we roll it out.

Tim.

Tim Grubbert 29:48

Yeah, I would basically like to repeat that sentiment. Maybe we can just, I mean just saying the the site meets industry standards when like looking at it, it basically means that we can use the basic API.

Then we should do that, write them down, and then experiment on the solutions that meet the KPI. I don't focus so much.

In the discussion now on how we can implement it, but more on the result that we want to achieve. Yeah, that's basically it. That's basically all I have to add to it because for the for the client that looks on the website, he doesn't care on how we did our animations.

Carolina Isfer 30:14

Mhm.

Tim Grubbert 30:28

Animations. He just wants the website to run out the way he expects it to, then said.

Carolina Isfer 30:37

Correct.

OK, so our approach then here, if I may summarize, is we will identify. So after this

meeting I'll send some documentation, we'll identify the three or four alternatives that we.

We selected that they are possible. We then run a small estimation as to which ones we think will be the the best cost performance and we try those first on a proof of concept of one or two of them.

Do a small proof of concept and test it against a standard page. So let's say we have we we work with the the company page and we replicate the that effect on the company page again and then we measure measure the performance of that one page.

Or whichever one we pick against this alternative. So it's it's like for like so to say. So we can say OK, it improves by this much or reduces by this much. The feel you can then compare look and feel and we do do it on a.

 **Clemens Lango** 31:50
Mm.

 **Carolina Isfer** 31:53
As small test as possible, so not looking after best looks, but rather after does it do the job. So if the circles are not perfect, so long as you know we have circles for the test that that should be enough to get us closer to deciding which approaches the. The best one for performance and then once we decide on the performance, we refine the assets and everything to make them then be what they need to be. Is that OK for everybody as an approach?
Alright.

 **Benedikt Eger** 32:32
Yeah.

 **Carolina Isfer** 32:33
The other there's one thing here that we have not talked about, which is the particle animation on the home page, which is the only element that was never substituted for a video and Michael.
The homepage is one of the non performing aspects. Um.

 **Michael Lemke** 32:53

I mean the particle animation still triggers from time to time out of no reason issues on phones or not. Sometimes it works, sometimes it's not. So if this would be a solution, I would be happy to go for it.

Carolina Isfer 33:00

Correct.

Mhm.

Michael Lemke 33:09

Is there any concerns from child team Martin Clemens from your side?

Clemens Lango 33:14

Nowhere no we all we also discussed with the we had this I would say close working together face with the homepage team and we tried to fix one thing after another and the last thing we discussed was the particles and also.

We mentioned the the frameworks and examples we sent over in the very early phase of the project and I think there were some changes and not everyone was aware that we had also these examples of other engines and there was.

I think that you said the team said of course it's out of scope to switch horses now in the end phase before launching, but we might investigate the particle engines mentioned when we are in the next project phase and maybe this will be a cool thing because honestly.

As I said, yeah, this is a pre rendered sequence of bitmaps I think and this was always to be sort of dynamic real particle thing. So if there's a chance to reevaluate maybe the things we once sent.

And to discuss on this level, this would be of course the coolest thing for the platform because then it will be really feel as intended. I don't know if it's a realistic point of timing and so on.

Carolina Isfer 34:33

Mhm.

Michael Lemke 34:35

Carolina, do you know what he's talking about? Do you have insight into those information which were sent over?

Carolina Isfer 34:42

That was the stuff that was exchanged with Thomas, right?

Clemens Lango 34:47

Yeah, and Benedict. Uh, weren't you?

Carolina Isfer 34:48

No.

Benedikt Eger 34:52

Earlier, I think, right. I think that that was something that was shared right at the beginning of the project.

Carolina Isfer 34:53

Benedict.

Clemens Lango 34:58

Yeah. And then again in the in the late phase before the launch where we already tried to fix the homepage things and we had a sequence of examples where exactly that effect is also demonstrated with code and explanation of the frameworks and there was the in the homepage team.

Was the idea that you could have a look at it when we have again room and are not in front of a release date. So I don't now.

Benedikt Eger 35:24

Yeah, then let's let's do that.

Carolina Isfer 35:25

Mhm.

Clemens Lango 35:29

Oh, great.

Benedikt Eger 35:30

Yeah, yeah.

Carolina Isfer 35:31

Yeah, so.

Clemens Lango 35:32

I can reshare things if you want, but I think, uh, we spread them those days. Uh, yeah.

Carolina Isfer 35:38

Clemens, if you could resend the package because there's been so much change between.

Clemens Lango 35:43

Yeah.

Yeah, of course.

Carolina Isfer 35:46

In people and and and that was at the start. So if you know what you're talking about, let's put it back onto the, you know, the established.

Clemens Lango 35:53

Yeah, OK, I can send it around.

Carolina Isfer 35:56

Yeah, and uh and for.

Michael Lemke 35:57

This document is here as well. This document is here as well that we see for the particle animation. I'm going back to initial ideas which have been.

Carolina Isfer 36:00

Yes.

Yeah.

Mhm. Yeah.

ML Michael Lemke 36:07

Already shared by China. Thanks, Clemens.

Carolina Isfer 36:10

Mhm.

Yeah. So we will then see what sort of efforts around that package. But as a minimum, I discussed with our motion designer a few months ago and we can use the current animation as it.

It exists and capture frames at a very, very slow speed and generate a video out of it as well in sections. So it's not it's not necessarily that complicated to generate a video from what we already have, so we don't need to start from scratch.

ML Michael Lemke 36:52

In the end the the the problem with the videos is user behaviour right? When when things are starting and people are moving up and down then then things do not feel like intended. So if we would have a native technology.

It would of course be preferred.

CL Clemens Lango 37:12

Also, the current animation doesn't have the fidelity, even if it's screen capture. Yeah, yeah, it's it's only a few frames and it's not dynamic, but I can I can resend the e-mail if it's not there and you see what the idea was. And this again is of course.

Carolina Isfer 37:13

OK.

Mhm.

CL Clemens Lango 37:31

Web GL accelerated typically, I think, and that's why it's really fluent and doesn't slow down any computer. Let's let's maybe just have a look at it again together in a separate meeting then.

 **Michael Lemke** 37:44
Alright.

 **Carolina Isfer** 37:46
And and I I just want to preempt that there are two two separate things going on here. So we have homepage that is somewhat performant but has the issue with the particle animation.
And then we have all other pages which are sluggish and non-performing that those definitely need to be working well for the incorporation of the sales and storage scope. And so Michael, if you can tell us.
Which one of those streams is priority? So we make sure that we focus first on let's solve this one and then the other second, because if we ever find ourselves in a situation where we need to make a decision to.
Cover this or that?

 **Michael Lemke** 38:35
So whether it's home, home page or the the content pages.

 **Carolina Isfer** 38:39
Yeah, So what? What is most important in the context of CF in general? All pages performance?

 **Michael Lemke** 38:43
The the content pages. So let's start with content pages. Let's fix this one and then go to the home page.

 **Carolina Isfer** 38:47
Content ages.
Mhm.
OK.
All right. So I believe that covers then this topic. Any further questions on performance that anybody wants to bring in?

 **Clemens Lango** 39:05

I'd maybe just the unliked thing that we had some colleagues. I think it was an iPhone 12 or 11 where the homepage did not work at all. So I have the feeling that. There are some tweaks might also be worth checking out. I would, for example, if it's possible on your side, do a video which has a smaller number of pixels because we have a lot of videos below each other. And they have 2560 pixels X&Y and if we would you would just do a test reduce them to let's say full HD as a square and again check what happens on devices. So let me get a feeling for if it's worth maybe.

Carolina Isfer 39:42

Mhm.

Clemens Lango 39:55

Exchanging those. So that's what I yeah, what we found out here, some colleagues just opened.

Carolina Isfer 39:55

Mhm.

Do a test case.

Michael Lemke 40:01

iPhone 12 iPhone 12 is working. I have iPhone 12.

Clemens Lango 40:04

Uh huh. I know. Was it 11?

Carolina Isfer 40:08

It would have been the older models for sure. Yeah, on my phone it doesn't work. For example, mine is a 10 pages doesn't doesn't load. OK, so that that that could be also a test case to be run.

Clemens Lango 40:10

Yeah, maybe.

Uh.

OK.

Yeah, when we are looking at it, I think we could also do a test there.

Carolina Isfer 40:26

All right. OK, then that covers performance improvement. Let's then move on to scaling.

Scaling.

So Michael, it would be interesting to understand exactly what you have in mind for scaling, right? We we have.

Michael Lemke 40:43

It is just that we have this problem that we're not allowed to do hyphenation and on some screens we have a German long words which then break and also in the content area and so we want to have a scaling concept so that the.

Um, headlines and um, copy texts are scaling to the screen size. That's the point.

Carolina Isfer 41:08

Mm-hmm. So that's not only header and stages, but rather all content.

Michael Lemke 41:13

Now as what I understood is you need to have a hierarchy, right? So it needs to fit together and so of course we focus on on stages and but you also need to go into the other ones because it it doesn't look.

Clemens Lango 41:14

No.

Carolina Isfer 41:18

Mhm.

Michael Lemke 41:29

Properly, if it's not in context, right, Clemens?

Clemens Lango 41:32

Yeah, right. Yeah. Like like you said, the the base issue was that we don't have

hyphenation and then in some cases when the diffs which contain the headline, the H1 get shrink smaller at some screen sizes.

 **Michael Lemke** 41:41
Thanks.

 **Clemens Lango** 41:48
A sub happens a forced line break and that's what what should never be. And the idea is to to define a rule set where the text diffs scale down.
Proportionally to the screen size or the view port and also the H1 headline clusters. So as soon as the disc shrinks, the large H1 font also scales synchronously. So we have a fluid H1 headline font size.
And we should then never have the case that in some screen width suddenly the headline breaks, which didn't do before on other screen sizes. So that's the basic idea and as Michael said, if we shrink.

 **Carolina Isfer** 42:31
Mhm.

 **Clemens Lango** 42:38
Between 2 specific we have an example there.

 **Carolina Isfer** 42:43
Let's see.

 **Clemens Lango** 42:44
Yeah, maybe we should also collect the worst examples in the first in the first one. Uh, that's the H2. That's even the H2. Yeah, yeah, yeah.

 **Carolina Isfer** 42:57
Oh yeah, mhm.

 **Benedikt Eger** 42:58
Yeah.

CL **Clemens Lango** 42:59

That's the H2, right? Yeah. So, so the solution set would be that we define these fluid headline and as soon as the H1 shrinks the the size contrast between H1 and HH2, the 1st 2 headline classes.

 **Carolina Isfer** 43:02

Yeah.

CL **Clemens Lango** 43:19

Get smaller. So this means to keep it in a good hierarchy, we also should scale down the H2 a bit. So as soon as we do scaling of H1, the second headline class, the next smaller one, the sub line should also shrink down a bit and that's the rules that we have to define. So we say.

For example, between break point, I don't know 1440, we have font size X and then it gradually scales down until it reaches the next break point and there it has size Y for example. So let's if a linear scaling between and we have to find out.

Uh, what is the best um best rule for this?

 **Carolina Isfer** 44:01

I have a question then Clemens, how do you plan on on roll out and what happens with the alignments as well because we have different alignments for very large screens.

As compared to you remember all the discussions we had about how the text sits in relation to to the images and I don't know we had like in very large scenarios that that the things do move about so they they're not always in the same place and.

Then scale up or down, but rather you have them in different positions. So that and a video substitution on top of it may need to be looked at collectively.

CL **Clemens Lango** 44:49

I think, I think ideally we don't have to invest any work in the text positioning, so it should ideally be only the headline class size and maybe time.

 **Carolina Isfer** 44:56

Mhm.

Yep.

 **Clemens Lango** 45:05

Yeah, maybe you can send around the worst case you found Michael one day and we use them as test case also so that we solve these issues concrete. Yeah, yeah, I think it's only the the CSS rule for the font classes which needs to be updated when we found.

Out which sizes are good and maybe the width of the headlines containing the the text. That's maybe also a new rule there. Let's say the H1 diff always is 60% of the screen width or something like this and it's and it's through the scaling.

Carolina Isfer 45:32

Mhm.

 **Clemens Lango** 45:44

And the phone also does and then we have no issue.

Carolina Isfer 45:44

Mhm.

OK. So is there anything that we should be worried about from a technical perspective for any of this or is this normal, a normal development?

Salvador Camarasa Sola 46:00

Well, we don't usually do this dynamic scaling, but I don't know how.

It's it's something I.

 **Michael Lemke** 46:13

But what I understood is not really, it's not really dynamic, right? Because we go by breakpoints, we just say breakpoint X has a certain size. So it's not that that we have fluent text sizes, right, Clemens?

Carolina Isfer 46:13

What is the standard approach?

CL **Clemens Lango** 46:28

We will have as as your if you scale down the screen width gradually without any jumps, just gradually, and you will also have a similarly gradually shrinking of H1.

ML **Michael Lemke** 46:41

Mhm.

OK. Then it's dynamic. OK. Yeah. Yeah. OK.

CL **Clemens Lango** 46:47

And so we ensure that matches and the technical implementation. We had looked around a bit and spoke to the desk. It typically is a sort of formula which defines the CSS font size. So it's something like, let's say 16 M or pixels multiplied or added 10% of screen. So that's the font size. So it's sort of a formula.

Which then of course the results in the dynamic font size because if the screen width changes then your formula gets another result. So the font size is different. So we we.

ML **Michael Lemke** 47:28

Saiva, So what was your answer to to this question? Sorry to interrupt you. So you wanted to say something about this dynamic implementation. What was your thought?

 **Carolina Isfer** 47:36

Yeah. How? How does it work technically from our side, Salva?

 **Salvador Camarasa Sola** 47:39

I had this moment I don't answer but no what what it's what Clemens says. Yeah there there there there are so on on the CSS we can actually do some.

 **Carolina Isfer** 47:45

No, no.

 **Salvador Camarasa Sola** 47:56

Calculations. I mean we got like formula functions to say so that allows us to calculate things on the fly depending for instance of the viewport size, these kind of

things. But if I understand correctly so.

Instead. So let me let me see if I'm if we are on the same page. So instead of giving fixed sizes for viewport ranges, what you propose is to instead of this fixed size, some sort of a formula depending on the viewport size. Is that correct? I'm understanding this correctly. OK.

 **Clemens Lango** 48:31

Great. Yeah.

 **Salvador Camarasa Sola** 48:33

Then yes, it would be possible. It would help us. Sorry, it would help us. However, if we could find some example or of this implementation of if you know of, I don't know, another website so we can pick and.

 **Clemens Lango** 48:46

Yeah.

Yeah, no, no problem. We we can show you. We have some examples and we also will will have finding the right way of calculating this. So I would say it's again hand in hand task between def and design. So we say at this break point it's it's always.

 **Salvador Camarasa Sola** 48:49

4.

Uh, cool. Fantastic.

Mhm.

 **Clemens Lango** 49:04

Let's say 20 pixels. If your viewport gets smaller, it stays this size, but if it gets larger, it grows until it's 14 pixels, 40 pixels for example. And we will we can investigate what the best formula or way it is. I also saw there's a command called clamp.

 **Salvador Camarasa Sola** 49:10

Mhm.

Yeah.

CL **Clemens Lango** 49:22

In HTML, which I'm.

 **Salvador Camarasa Sola** 49:23

Yeah, or like some sort of min Max or something like that.

CL **Clemens Lango** 49:25

I have a minute mark and we have a scaling, so that might be different approaches, but but they're all examples on the web out there.

 **Salvador Camarasa Sola** 49:31

Uh huh.

OK, because because in this case CSS is a bit limited because with CSS has natively this calc function, but it I'm not sure if the latest specification has a bit more math. Stuff in it, but perhaps if we don't reach it by CSS, we should do a JavaScript approach if we need more complex because complex stuff. Basically because CSS what it supports for sure it's you can sum rest so you can divide, you can multiply, but not.

CL **Clemens Lango** 49:53

Yeah.

 **Salvador Camarasa Sola** 50:12

Much else. So I mean there are no at this moment fully compatible through all browsers. There is not many math functions out there only for CSS, but.

CL **Clemens Lango** 50:24

Yeah, I think we find we find a solution. We can also have a fallback or the very, very old browsers which don't have the scaling then maybe, but they're eight years old or whatever. So there are enough examples out there and we can have a look at them and find a way surely.

 **Salvador Camarasa Sola** 50:27

Show.

Mhm.

Now.

 **Clemens Lango** 50:39
3.

 **Carolina Isfer** 50:41
OK, Lemons, then in in in this context, it feels that the scaling is a much easier solve than the performance. So I was wondering if we can treat scaling 1st and you could.

 **Clemens Lango** 50:41
Hello.

 **Carolina Isfer** 50:55
Finalise that or send us material for that first. You know, whenever you start working on this, that that stuff comes to us immediately so we can get the the developers working on it already while we're then developing the proof of concept for the. The remaining.

 **Clemens Lango** 51:12
Um, uh.

 **Carolina Isfer** 51:14
Or do you want to tackle everything together?

 **Clemens Lango** 51:14
Yeah, it's it's not. It's not done in a second because we really have to test the front hierarchy and the boundaries and the maximum min.

 **Carolina Isfer** 51:25
But I wasn't talking a second. I'm thinking like we still within the say the first half of January if possible like.

 **Clemens Lango** 51:33

We we could do it as a first thing if it's for you, so we're flexible. So if if we all agree, let's do this order or whatever, then we're fine with everything.

Carolina Isfer 51:35

Yeah.

Mhm.

OK. That's great.

All right. Then I think that covers then scaling. Any other points on scaling?

All right. Then Michael, just with the hyphenation, yeah, so we we will be addressing the scaling concept. We'll address page one, page two. It will not go into paragraphs that much, right, Clemens or is the idea that it goes on everything.

Clemens Lango 52:18

The the scaling rules would be global, so it's like global CSS and would apply to all H1H2 texts because otherwise you would get inconsistencies in the design and no.

Carolina Isfer 52:20

Mobile.

Yeah, yes, I understand it for H1H2, but for the remainder of of classes.

Clemens Lango 52:37

And the smaller ones don't have to scale, because if you have a copy text field, you have to have a clearly readable size and you can't shrink it because otherwise no one can read it. So typically the system only applies to the larger fonts, so that's what you can find outside and the small fonts that need to be readable.

Carolina Isfer 52:44

Just.

Oh.

Clemens Lango 52:57

Already now have the best size for it for for the case and I would say we leave them untouchable.

Carolina Isfer 53:03

So, so with this then Michael, we still have the font, the the the hyphenation word breakage issue in the copy text that does that.

 **Michael Lemke** 53:17

Yeah, but this is not so. It's not so much of a problem. It it doesn't look too bad when we have paragraphs. It's it's more about making sure that energy infra stroke tour gazettes if it's in the headline.

 **Carolina Isfer** 53:20

Not so important.

OK.

All right.

 **Michael Lemke** 53:34

It's not trickling down. That's that's the point.

 **Carolina Isfer** 53:36

Is that OK? No worries. OK then that is fine. The Third Point then which we have to to cover, it's a very quick one, content creation, flexibility. So Clemens and Martin, just so you are aware.

Michael wants to have more options in terms of setting CTA links, so we created the CTA the the link profile based on the the directions from the design. So for example. Certain links only allow MAO2, certain links only allow press releases because of where they are. But in the the creation of the pages micro identify the more combinations would be necessary. There is no design alteration as such.

To these. So we will progress without necessarily involving you in this loop. However, if we do have questions, if any design items pop up, then we will bring them to you and say this so you know that this is the context where we're investigating it, but our approach is to at the moment.

We are finalizing a mapping of what each module can do in terms of links and then we're doing a gap analysis and addressing the gaps. So that's our approach. It's something that's already in motion and we'll be doing that as soon as our CMS development team is back in January. So that will be also one of the.

First things execute OK.

CL **Clemens Lango** 55:15

Yeah, sure. 11 hinto would be great if you could track those things so that we can, so that we at least know which ones do not have an excellent in the design files, you know, so that we know that we need to investigate the live page, for example, if we just.

 **Carolina Isfer** 55:28

Mhm.

CL **Clemens Lango** 55:34

Discuss designs or anything.

 **Carolina Isfer** 55:35

OK. Yeah, I will share all the the material with you. So the the the mapping that we're doing and the decisions of what will be changed to what and then you have all that information and you can then document that as well, so.

CL **Clemens Lango** 55:46

Yeah.

 **Carolina Isfer** 55:49

We'll keep that done. All right. So we've reached the end of the first hour, so in the end we might need the whole 2 hours. I would like to offer us a quick break. I need to top up my water bottle and we may need.

A little break. I certainly need to pause the recording and get a new transcript, otherwise AI cannot roll the whole thing at once. So how about we come back at 2:05?

ML **Michael Lemke** 56:08

OK.

CL **Clemens Lango** 56:12

Get a new hard. We need to get a new hard disk for the recording.

Carolina Isfer 56:18

Yeah.

Michael Lemke 56:19

205 is fine.

Carolina Isfer 56:21

2:05 Alright, see you soon.

Michael Lemke 56:22

Thank you. See you in a bit.

Clemens Lango 56:23

All right.

Carolina Isfer 1:02:20

Anyone?

Speaker 1 1:02:22

Hello, good afternoon.

Carolina Isfer 1:02:24

Good afternoon. I heard you're moving offices, isn't that right?

Speaker 1 1:02:29

Not not moving offices, just opening a new one in Rotterdam.

Carolina Isfer 1:02:35

All right, that would be busy right before Christmas.

Speaker 1 1:02:40

Yeah, unfortunately during Christmas.

Carolina Isfer 1:02:43

Wow, that is messy. How is that going?

Speaker 1 1:02:46

Yeah, it's it's going OK. I think we'll make it. 6th of January is go live, so we've got plenty of time. Shouldn't be a problem. A bit closer to home than Singapore, luckily.

Carolina Isfer 1:02:57

All right.

Yeah, right. OK. We had, we covered the first hour of the the meeting talking about the improvements and we just had a little break. So now everybody's coming back and we're going to kick in with the release to conversation. So very timely.

Only that you join us now.

Speaker 1 1:03:20

Uh, maybe I I I thought my my mic wasn't working. Maybe everyone would just quietly enjoying the break.

Clemens Lango 1:03:21

Oh.

Carolina Isfer 1:03:27

No, they were. We said 205, so we're all back recharged. I filled up my water bottle. We're good to go for another hour, I guess.

Clemens Lango 1:03:28

And.

Speaker 1 1:03:37

Excellent.

Carolina Isfer 1:03:39

Yeah, I'm just, um, so we're gonna have just Benedict and Salva when you're in to say

hi.

Tim, you're there.

Benedikt Eger 1:03:47

I am. Hello.

Speaker 1 1:03:50

Hello. Hi.

Clemens Lango 1:03:51

Hello.

Right.

Carolina Isfer 1:03:56

Right. So Tim, we have Nimrod joining us. You have not met him and Nimrod, you haven't met him. Tim will be joining our team for Release 2 to support us in coordination between design and development. We.

We understand that that was one of our Achilles heels in the first phase of the project, so we are addressing it to try more people and the right people to do the right job.

Speaker 1 1:04:30

Excellent.

Carolina Isfer 1:04:31

Yes, right. So let's then talk release 2 and our initial ideas for release 2. So Nimhat and Michael, please challenge anything that I put forward.

If you believe that it's incorrect, the information that I'm going.

Michael Lemke 1:04:56

Carolina, you know us. We always challenge you. You don't need to ask.

Carolina Isfer 1:04:58

I know, I know.

But I was saying that so that it's captured in the recording. The information that we

are going that we are using that to start from is the material that was provided to us in the RFP back in 2024.

So a lot has changed priorities that say if it may not be what they once were when that document was created. So if anything is outdated, please let us know and then we can.

We can update our knowledge. Also, if you do have more material or recent information, anything that you think is relevant to send over, please do so.

So our understanding of the general scope for Release 2 is the integration of the sales and storage entities into one single CMS platform. At the moment we are now on first spirit and the other sites are in other CMS.

I'm not familiar which ones, but not necessarily that relevant and that we want everything to be in first spirit. So we need a confirmation of exactly which market sites or business units or businesses, how you talk internally and then.

Also an understanding of how is it that it's like do we still have many sites but all from first period, so different URLs or is it all from within the safer?

Single URL where you will navigate to subpages. So what what is the idea? How how is this playing out?

 **Michael Lemke** 1:06:52

So we want, as you said, have all our websites on one CMS, right? So have I I don't know how, how, how it's called in in first spirit, but have one project.

 **Carolina Isfer** 1:06:59

Mhm.

 **Michael Lemke** 1:07:08

Environment, but there are different sites in there, so the URL will stay as as they are right now, so we will not change them. So it will not be a top level domain strategy that we then say.

 **Speaker 1** 1:07:19

Um.

 **Michael Lemke** 1:07:28

They use slash energy. This will not happen. They they keep their own URLs, but they're all, yeah.

Carolina Isfer 1:07:30

Mhm.

Speaker 1 1:07:35

So, so so Michael, they keep the the their own URLs, but the URLs will essentially be pointed to our environment with UDG.

Carolina Isfer 1:07:35

The.

ML Michael Lemke 1:07:47

Exactly.

Speaker 1 1:07:48

OK.

Carolina Isfer 1:07:50

Yeah.

And so situations such as, for example, Safe Energy UK, you're going to continue to have Safe Energy UK. It's not that the English version of.

ML Michael Lemke 1:08:02

Mhm.

Carolina Isfer 1:08:07

See if energy, Dutch, Netherlands, the English version of that is the UK version or do you're gonna have no?

ML Michael Lemke 1:08:17

No, no, no, no, no, no, no, no, no, no. The the UK version is for the market UK, so each top level domain points at the offering from a certain certain market.

Carolina Isfer 1:08:33

OK. And so it could be that we will have multi languages per market.

ML Michael Lemke 1:08:37

Exactly, yes, but mostly only local language plus English.

Carolina Isfer 1:08:44

Yes, multilingual, local language plus English. So there is no situation in which we're going to have all languages, a site with Dutch, French, German, English, etcetera, OK.

ML Michael Lemke 1:08:56

No.

Speaker 1 1:09:00

And Michael, as important as what's in scope, I think it's also very important to discuss what's not in scope. So the sales part of the business has sales portals and the kind of different platforms. Are we doing anything with those? So obviously those are massive undertakings.

Carolina Isfer 1:09:11

Mhm.

ML Michael Lemke 1:09:18

We don't touch any any internal systems which are provided to customers. We only talk about the websites and nothing which is behind any login or something.

Speaker 1 1:09:19

Which?

OK.

Carolina Isfer 1:09:34

So, so we would we would have a login entry area and you would provide a link to whatever that is. Once you're here, you're already out. This this page is already out.

 **Michael Lemke** 1:09:42

Mhm.
Exactly.

 **Speaker 1** 1:09:47

And there'll be no desire, Michael, at some point. And I'm just thinking ahead that maybe our stakeholders and ahead of someone else will say, well, maybe it's not such a big deal if we just change the landing page to meet, you know, to match the look, right. So we're not.

 **Carolina Isfer** 1:09:48

OK, so.

 **Michael Lemke** 1:10:02

This, this. So there are certain things. So what I'm doing right now, this is for your information. I'm working with John Cottrell.

On the Power Platform and he used to have a a project going on where he wanted to harmonize the different portal layouts, but this has been cancelled more or less.

And so we are working in a separate stream to harmonize everything. But I think the landing page topic is an interesting one, and it would be good if we could actually design the landing page and then reach out. So there's nothing for for you.

You, Carolina or something. This is then something which you, Nimrod and myself, we have to organize with the owners of the portal so that we can change the landing pages that they look the same. It's a good point.

 **Speaker 1** 1:10:58

Yeah, I I agree. I think it's worth investigating and JQ is definitely one of the better stakeholders. So it's good that he's involved.

 **Carolina Isfer** 1:10:58

Mhm.

 **Michael Lemke** 1:11:02

Yeah.

Can you document this in in your list so that we don't forget this, but label it clearly as a as a zaple in Z for internal topic. Thank you.

Carolina Isfer 1:11:07

Mhm. So.

Mhm.

Clemens Lango 1:11:22

One question, you mean that only the landing page of these additional sites might be customized or brought in line with the design and the other not?

Michael Lemke 1:11:33

Mhm.

The other one, not no.

Clemens Lango 1:11:37

OK, so as soon as.

Speaker 1 1:11:38

Yeah, so it depends on. It depends on how the and again, this is an internal topic. It depends how they've programmed it, what's the platform, because it might be as easy as if we just change the text color and the background and then it's persistent across the entire portal.

Then it's not just a landing page. It'll be the whole, you know, in a couple of clicks, in a couple of hours worth of effort, we can make it look quite similar to our corporate website. On the other hand, if it's a lot of work and we don't have the we're unable to prioritize the resources internally, then maybe we'll leave it. But that's that's for myself and Michael and maybe.

Michael Lemke 1:12:09

Mhm.

Speaker 1 1:12:12

The other stakeholders just to see what we can, what we can do.

 **Michael Lemke** 1:12:14

The the problem Clemens here is that that we have not a single owner for portals. We have I think 5 portals and each portal has multiple owners. There's no consolidation in this activity. This will take some time.

 **Speaker 1** 1:12:20

He.

 **Carolina Isfer** 1:12:23

Mhm.

 **Clemens Lango** 1:12:25

Yeah.

 **Michael Lemke** 1:12:30

I I would love to do that but this is out of scope huh. So we we we talk until landing page and then stops.

 **Carolina Isfer** 1:12:35

Yeah, but if you if you look here.

 **Clemens Lango** 1:12:39

OK.

 **Carolina Isfer** 1:12:39

Yeah, so Michael, for for an example of what can happen, it just happened here right in the Dutch page. When I click on login, I am redirected to a page that lists all the portals and then I have for each one of them a login, right? Whereas it's different.

 **Michael Lemke** 1:12:57

Mhm.

 **Carolina Isfer** 1:12:59

Different to the UK one where I click login and I already go to that portal. So is

something like a page like this to be considered in scope a page where all logins or possible logins are?

 **Michael Lemke** 1:13:15
Content.

 **Speaker 1** 1:13:16
Yeah, I agree.

 **Carolina Isfer** 1:13:18
So yeah, of course you would be creating it with modules and stuff, but yeah, OK.
And then from here on it just points to where it needs to go.

 **Michael Lemke** 1:13:18
Its content.
Yeah, yeah.
Mhm.
Mhm.

 **Speaker 1** 1:13:28
Yes, if you click on one of those logins.

 **Carolina Isfer** 1:13:31
Yeah, you go to.

 **Speaker 1** 1:13:31
Any random one exactly. We want this to look like the corporate landing page, right?
Same font, same colour. Again, if possible, if we have the resources, if we're able to do it.

 **Carolina Isfer** 1:13:36
Mhm.
Mm-hmm. OK. And that is outside of our scope and chills, OK.

 **Speaker 1** 1:13:46

Yeah, we'll have to figure out who owns that particular portal as opposed to the energy portal, and it's it's a bit of a mess.

Carolina Isfer 1:13:49

Um.

No worries. OK. So in terms of just confirming then which sites are in, so we have safety Energy UK, the Dutch side, the French side.

The German side.

And and then the storage site. This is the German site and that's the storage site, correct?

Michael Lemke 1:14:17

That's correct. When you go to the go again to the Netherland page, to the second tab, please.

Carolina Isfer 1:14:26

This one.

Michael Lemke 1:14:27

The second tip.

Carolina Isfer 1:14:29

I can type.

Michael Lemke 1:14:32

Can you go up?

Carolina Isfer 1:14:34

Yeah.

Michael Lemke 1:14:35

OK, take to look in that way.

Click on the Zipher Energy at 1234. Yeah, exactly those four.

Carolina Isfer 1:14:40

Yeah.

That's fine. OK, so.

 **Michael Lemke** 1:14:47

Lus the even storage.

 **Clemens Lango** 1:14:48

It.

 **Carolina Isfer** 1:14:49

Yeah. And so SEFE fibre at the moment, it is a product of.

 **Michael Lemke** 1:14:53

Zefer Fiber is just exactly. So they have created something which looks like an entity, but it is. It is actually a product page from Zefer Energy.

So again, this is just content. This is just content.

 **Carolina Isfer** 1:15:09

Mhm.

So this this would go into safe energy as a product availability. There's just more information associated with this product that is enough for for their website, but we would not need to worry about this being a site on itself with that domain that will disappear.

 **Michael Lemke** 1:15:15

Mhm.

Mhm.

 **Carolina Isfer** 1:15:29

What do they still want to have?

 **Michael Lemke** 1:15:32

No, we would keep the domain, I think.

Carolina Isfer 1:15:35

Then then it's a fixed. It's an extra site for technical.

Michael Lemke 1:15:38

Yeah. OK. Then put put it as a as a fifth, yeah.

Carolina Isfer 1:15:43

Yeah.

And the cascade is out, correct?

Michael Lemke 1:15:54

Yes.

Carolina Isfer 1:15:57

All right, so cascaded it.

Michael Lemke 1:15:59

It's their own brand, so to say, we don't cater for them.

Carolina Isfer 1:16:02

Yeah.

Mm-hmm. OK, it's completely out, but you do link to it from your corporate page.

Yep.

Michael Lemke 1:16:08

Yes, we do, yes.

Carolina Isfer 1:16:11

OK.

All right. Then in relation to functional requirements, so we understand that there are a lot of functionalities that are required, the various ones. Nilhal, yes.

Clemens Lango 1:16:25

OK.

Speaker 1 1:16:26

Maybe just a quick one before we move on to requirements. Michael, maybe one for you. Do we need to worry or consider anything from we, so Romania, Hungary, anything from Eastern Europe?

Carolina Isfer 1:16:28

Yeah.

Michael Lemke 1:16:39

No.

Speaker 1 1:16:41

OK.

Michael Lemke 1:16:41

Is there anything which is ever branded?

Speaker 1 1:16:44

I just know that I'm, I'm also, I'm working on a another little initiative in terms of bringing the Romanian accounting infrastructure into our area and there's a website there that no one seems to know what to do with.

But never mind, I'll take it offline and then I'll reach out to you if I think we need to discuss it.

Michael Lemke 1:17:03

I mean in the end, in the end, what we are focusing on to make it clear is to understand how we can communicate the office offering from safer energy and safer storage within the new design concept.

Clemens Lango 1:17:05

OK.

Michael Lemke 1:17:18

And then bring it to our environment, production environment which is first spirit. If

there's later any other page which we need to integrate like the Romanian one or Hungarian one or whatever you said, we will do this then via the existing. Modules and content containers which we have. So we would then rebuild this page and add it there. So we don't need to take a look at how they are communicating right now and translating their content. Let's focus on the offering from energy and storage.

 **Clemens Lango** 1:17:47
Understood.

 **Speaker 1** 1:17:59
Understood.

 **Carolina Isfer** 1:17:59
OK, yeah.

Then within the offer from those two, we identified a few functionalities that exist and that we want to know if they will be required or not. They were also mentioned in the original RFP. They are integration of jobs.

Through SuccessFactors, get a quote, Product Finder, there's an FAQ system, a live chat, auction products and forms everywhere.

 **Michael Lemke** 1:18:34
There are more applications we we have, we we have a list and this list we have provided to you several times. There must be more applications.

 **Carolina Isfer** 1:18:34
So down more.
There are more applications.
Let me bring the other file that I have here. There's a big list of them, but though though, so I'm talking two separate things. I'm talking functionalities that will need to be rebuilt. It's different to applications, so applications would be this list here.

 **Michael Lemke** 1:18:59
OK, my mistake. Yeah, yeah, yeah. OK, yeah, yeah.

Carolina Isfer 1:19:07

That I was what I had. So you have Salesforce, Google Analytics, you Marketing, Trustpilot, high charts, user centric, etc. So the at least that yeah.

Michael Lemke 1:19:17

Yeah, yeah, exactly. This is what I was talking about. Yeah, yeah, perfect. I I was not differentiating between functionality and application. My mistake. Sorry.

Carolina Isfer 1:19:21

So we will.

Yeah. So for because for functionalities, right, they exist in this space between there is a design interface that we will need to understand. There's a business, a logic that we're going to need to handle to then send things via API or back or sometimes there is no API, there's no nothing to.

Michael Lemke 1:19:28

It.

Yep.

Carolina Isfer 1:19:46

To be done there and we need to handle the logic ourselves to make it happen again. So that's a function. Yeah. So the first one then that we have here by no preference is success factors, career integration. So there was a request.

Michael Lemke 1:19:54

Yeah, yeah, understood. Understood.

Carolina Isfer 1:20:06

To have.

Two or three?

Job postings featured on the main page. So for example you would be on the SEFE website that one out in the career area.

 **Michael Lemke** 1:20:25

O It would be something like those social media feed modules, right?

 **Carolina Isfer** 1:20:31

Yeah. And then you would, you would put some highlights and say this job, this job and this. So you'd be pulling data.

 **Michael Lemke** 1:20:34

When? When was this communicated? Who communicated this?

 **Carolina Isfer** 1:20:40

This was part of the RFP 2024.

 **Michael Lemke** 1:20:43

OK.

OK.

Yeah.

 **Monika Morgenroth-Mohr** 1:20:51

Perhaps the idea is to integrate top, top offers or whatever directly on the site, but the complete portal will still be out. That was the.

 **Michael Lemke** 1:21:02

OK.

Yeah, I understood. But in the end it it it's a normal functionality like what you do on feed grabbing from social media, right? We we had already something similar in plan with the release one where we had this module for LinkedIn feed.

 **Monika Morgenroth-Mohr** 1:21:05

Topic there. Mhm.

 **Michael Lemke** 1:21:21

Remember and so it would be something like that then.

Carolina Isfer 1:21:22

Yes.

Benidy, can you confirm that that is the approach would be somewhat straightforward?

Benedikt Eger 1:21:31

Just a question about that. Would we, how would we select which three we're displaying? I mean, we can of course use the data that that comes from SuccessFactors, but would you as an editor want to? Still influence.

ML Michael Lemke 1:21:49

I can imagine that we would like to influence that. The clear user intent we need to clarify in the next phase, but it's a good question on which level we want to manipulate the selection, but I can't answer to that. We need to talk with the owner.

Benedikt Eger 1:21:50

Which three? Yeah.
OK. Yeah.

Carolina Isfer 1:22:07

Yeah.

ML Michael Lemke 1:22:08

Owner of this specific request.

Benedikt Eger 1:22:11

Yeah.

Carolina Isfer 1:22:13

Because that adds adds complexity.

ML Michael Lemke 1:22:13

So let let's takedown. Yeah, let's takedown this question on how detailed the.

Carolina Isfer 1:22:18

Mhm.

ML Michael Lemke 1:22:22

Yeah, user rights should be to manipulate the the content, whether it's just grabbing the first the latest three or whether they want to have own power to select what they want to show. How much can they?

Carolina Isfer 1:22:28

Yeah.

Mhm.

ML Michael Lemke 1:22:39

Influence the editing.

Carolina Isfer 1:22:45

OK.

Then the other the the the next one is the get a quote which is.

A form interface.

So.

The questions we had were in relation to. I don't know. I don't even know how to fill this one, but.

So pick a pick a date.

Yeah, and then you get.

No submit button.

Anyway, it's a form interface, so So what happens? Like we need to understand how it how it exists. Is this really form information that gets sent simply as a form? Is there data?

Rocessing that needs to sit behind it.

ML Michael Lemke 1:23:43

So also we have no, I don't have any detailed information on how they work on this, an assumption based on the functionality and the smartness of the results and this this tool, right? In the end they are not a lot of products.

And no matter what you put in there, it's most of the time the same. I have built something similar once for TK Elevator, also in first spirit, and this was a simple Excel sheet with rules which were put into more or less into the back.

Carolina Isfer 1:24:08

Mhm.

Mhm.

Michael Lemke 1:24:23

And and this then was somehow mapped, right? So you had certain answers for a certain product and this was how it was done.

Carolina Isfer 1:24:34

So we can't. We don't expect anything overly complicated in the selection process.

Michael Lemke 1:24:35

But um, the.

I don't believe that this is too much complicated, but I can't give 100% assurance to that because I I don't know what they have programmed here.

Carolina Isfer 1:24:50

OK. So Chio, in this respect, I'm not too sure if you had a chance to look at all the sales and storage sites, there are forms everywhere that is really form heavy in contact in in generator products etcetera. So we.

We are looking at working with a a dynamic form generator, so we really have the highest flexibility for for safe to to build these forms, but we will need to accelerate the design.

Of the parts we don't have. So for example result pages such as these or so there might be elements that that are not yet designed and part of the data gathering is to collect all the the knowledge that sits behind these forms that we're going to be getting.

From from the businesses, but then there is a an output of the gaps that we don't have that would need to exist in this form generator so that it works the way it should.

Benedikt Eger 1:26:01

And this is actually one of the more complex cases or possibly complex cases because this form can also calculate some results if you I think if you have a low lower annual consumption you get.

You'll get a direct quote without just sending the form, and that would also be interesting to know.

How is that data calculated?

Michael Lemke 1:26:32

Mhm.

Benedikt Eger 1:26:34

Is there, is it as you say Michael, is it just just an Excel file that we have to evaluate or is there some kind of third party system behind that has pricing and?

Carolina Isfer 1:26:47

Mhm.

Benedikt Eger 1:26:48

Other stuff inside.

Michael Lemke 1:26:51

We can't answer. We are not the business owner.

Benedikt Eger 1:26:51

And they all.

Carolina Isfer 1:26:52

Yeah, we don't know that yet.

Benedikt Eger 1:26:54

Yeah. And the overall question for all forms is where does the data go? Is it just sending an e-mail to somebody or is it a CRM connection or something like that?

 **Michael Lemke** 1:26:55

But I am.

 **Carolina Isfer** 1:27:07

Yeah. So, so those questions we will seek, we will seek answers but but it is, it is understood that we will need to really look into forms. So Cheo, we have the forms, the fields, designs and all the the basics of the forms there, but we will need to to extrapolate that.

 **Benedikt Eger** 1:27:08

Yeah, yeah. No, it's just.

 **Michael Lemke** 1:27:09

Again.

 **Benedikt Eger** 1:27:16

Yep.

 **Carolina Isfer** 1:27:26

This is one of the things that we believe we should tackle first because a lot of the design is already completed for it, so we can really get going with the the technical part and and work in set in in multiple streams.

 **Benedikt Eger** 1:27:31

No.

 **Carolina Isfer** 1:27:41

Another element is then this product Finder.

Which again is a form interface, but it's a it's a on the side type of form interface inside a container and you would then pick and choose things.

Multi information there and and there is a a a mix of form and filter at the same time because in in essence I'm choosing filters here. You know these these are not.

These are not it's not a form that I'm sending a result, but it has a form interface to then tell me these are my my products underneath. So the product options. So

there's there's a an interesting logic to understand.

How that works? Do we get many different results with all of that? But it it starts with a form interface there.

That is a future and we we certainly don't have that.

 **Michael Lemke** 1:28:49

OK, but there are two things, right? So first of all, this is a task for child and the business to understand how we actually can.

 **Carolina Isfer** 1:28:56

For child mhm.

 **Michael Lemke** 1:29:02

Design the product Finder and the live quoting tool. And then there's a second one which is from you to the business to understand what is the application behind it, right? And here again, I need to correct myself, I mixed up the live quoting tool.

 **Carolina Isfer** 1:29:04

Mhm.

The logic handling, yes.

 **Michael Lemke** 1:29:22

With this one, this is most probably only a easy excel file. The live quoting tool is much more likely a little bit more complex. I think this is the easy one, but the other one is more complex. I mix mix those two up.

 **Carolina Isfer** 1:29:26

OK.

Mhm.

Yeah.

So Martin and and Clemens, the the understanding of all of this then will will be something that we both need to have and and then of course you will come, you know we will complete the designs.

 **Michael Lemke** 1:29:41
OK.

 **Clemens Lango** 1:29:44
Mhm.
Hmm.

 **Carolina Isfer** 1:29:55
Ahead and and I I imagine that this will be something we'll be doing slightly later. We will take a bit of time in understanding all of it, perhaps doing a proof of concept, getting approval from the the the own, the product owners here to then. Go and and roll out implementation. So we need to do multi steps in this to to make sure that we get it right.

 **Clemens Lango** 1:30:18
Yeah, I think it's the same way of working on both of our sites. So we first have to capture what are the requirements, which cases exist, mobile, large screen, whatever states and so on. And then you know what you and your flexible form system have to achieve and we find certain black spots which are not.

 **Carolina Isfer** 1:30:27
Yeah.

 **Clemens Lango** 1:30:38
Yet designed and so we have sent to you so that everything comes together, right?

 **Carolina Isfer** 1:30:39
Mhm.
Correct.

 **Clemens Lango** 1:30:44
Yeah.

 **Carolina Isfer** 1:30:45

The other element that we have here is the FAQs. So the FAQs are very comprehensive. I don't know why it's not loading.

 **Michael Lemke** 1:30:58

Yeah. So right now they have their own tool which they have bought. It is, it is a tool. It is a content management tool within the content management system. It's their own FAQ tool.

 **Carolina Isfer** 1:31:02

Mhm.

 **Michael Lemke** 1:31:14

And so I think the question is whether we can maybe integrate that into first spirit and and before we go into designing this one, we should first explore the technology.

 **Carolina Isfer** 1:31:17

It would be smarter, yeah.

 **Michael Lemke** 1:31:30

Behind that, understanding how we actually want to solve this FAQ topic and then we can, I think, take a look at the design. I think this would be a better way to do so.

 **Carolina Isfer** 1:31:42

Mm-hmm. OK. So this one would start and from our side Benedict, because it it is a very, yeah, it it, it is very complex in in the the way that the data is presented etcetera. And if we had to rebuild something like this, this would be quite.

 **Michael Lemke** 1:31:45

It.

 **Benedikt Eger** 1:31:48

Yes.

Carolina Isfer 1:32:00

Hefty. So if there is a way to work with this tool, by all means.

Michael Lemke 1:32:06

Also content transition wise they they they have a lot of articles there.

Carolina Isfer 1:32:07

Absolutely, yeah.

Mm-hmm. Maybe this is where the 1000 pages comes from.

Michael Lemke 1:32:16

Yeah, this is what I think as well.

Carolina Isfer 1:32:17

Yeah, yeah. Another element that we have to consider is this live chat. So we have on the sites after you Scroll down at some point you get this this chat.

Window where you're gonna have somebody available and it has some states in terms of when there is somebody business hours.

Coming in, not nobody available. Collect data. There's again a form interface here if you don't have, if you if there is nobody there. But this is an application, so it's powered by live chat.

So I don't know what sort of control we have in the way it look and in the look and feel of it to say, hey, it's going to be designed this way or that way. So this is something we need to to look at as well in terms of the two interface.

And if I'm not mistaken, this is provided by SAP.

Michael Lemke 1:33:20

I can't say. I'm sorry.

Carolina Isfer 1:33:22

You can't. Yeah, I think there was some information there. So that that just needs a good understanding of limitations. We may have that.

And then connecting it.

And uh, auction products we have then.

This section which is probably more of a modules design where you have this this cards with product information and you click on them and you still get the card with some further.

Blocks of of information here. So the idea is, is this all content?

 **Michael Lemke** 1:34:10

So this is content, but when you click on the Prisma handles latform then you go to application.

 **Benedikt Eger** 1:34:11

OK.

 **Carolina Isfer** 1:34:12

Yeah.

The application.

 **Benedikt Eger** 1:34:19

Yes, but but also for the content we were wondering, is that something that somebody actually maintains by hand in the CMS or is there a data import behind that?

 **Michael Lemke** 1:34:30

I believe.

It is done manually, but I think taking a look at this and taking a look on how things are structured, it could make sense to have a database for that, right? Because then it would be very, very easy to.

Change and you could also have a look in the back end, but again we need to double check with the owner. But I think the idea of a database, if all those are the same, would be a good approach.

 **Benedikt Eger** 1:34:57

Mhm.

Yeah. OK.

Carolina Isfer 1:34:59

No.

Benedikt Eger 1:35:07

Yeah, because there are pages that are much more of these entries and just seems like a lot of work to maintain this by hand.

Carolina Isfer 1:35:07

Mhm.

Yeah, and you have these tables and stuff it it it smells of Excel in the background or some sort of structured, structured database, structured information. You have documents. So Cheo for you there is then an understanding of.

Benedikt Eger 1:35:18

Yeah.

Yeah.

Michael Lemke 1:35:30

It.

Carolina Isfer 1:35:34

This system or whatever sits behind it, so we can design to it to make sure that the connections then are are correct.

Clemens Lango 1:35:45

Yeah, we just discussed we we're not sure if we have 100% feeling correctly which parameters are copied exactly and which are changed because we understood that we at least would bring the home pages of the different sites to the same look, but we let the sub pages.

Carolina Isfer 1:35:45

Uh.

Clemens Lango 1:36:05

Visually a bit more untouched, but might change headline and headline class and background color, but the rest would stay the same. That's what we understood before.

Carolina Isfer 1:36:19

As in not designing new modules for this stuff.

CL Clemens Lango 1:36:22

Yeah, we understood that only homepages are practically redesigned so that the look in line with safer dot EU and if what we are currently on is a sub page of safer storage and we currently.

Carolina Isfer 1:36:22

Is that what you?

CL Clemens Lango 1:36:38

Understood that it's more technical migration from one CMS to the other, but all the different tables and objects and things remind like they know are, except for background color maybe. Or is it? What did we understand wrong?

ML Michael Lemke 1:36:53

Yeah, you you did understand wrong. I I mean we make mentioned this several times that that we need to create additional modules. So we have a module or how how do we call this an Organism.

CL Clemens Lango 1:36:56

OK.

ML Michael Lemke 1:37:09

Library right now, which we use to build pages and we of course will use as much as possible of those organisms to build the pages here, but of course they have different content.

Carolina Isfer 1:37:13

Mm.

 **Clemens Lango** 1:37:23

Yeah.

 **Michael Lemke** 1:37:26

And they have different needs and so we need to develop most probably a few additional modules. This has also been offered by Sven in when you take a look at the offer which has been provided and I think it says 20 or twenty-five additional modules or something.

 **Clemens Lango** 1:37:37

Yeah.

 **Michael Lemke** 1:37:46

So this was always in scope.

 **Clemens Lango** 1:37:46

Mm.

OK, yeah, I thought there was an intermediate another step internally which shrinks things down, but maybe that's wrong then, yeah.

Mhm.

 **Carolina Isfer** 1:37:59

Yeah, if we look at the the pages themselves, of course you have your text modules, your image, you know all of that, that that that's all fine and we can we we will have this stuff. Maybe we don't have a site navigation anymore, etcetera. So those things will disappear.

 **Michael Lemke** 1:38:01

OK.

Exactly.

 **Carolina Isfer** 1:38:17

But for sure, you know links and texts, that's all covered and we may need to adapt a module here and there to to open a use case to it. But certainly these functionalities

are nothing that we have planned before apart from the forms which we knew would exist.

No.

 **Clemens Lango** 1:38:36

Yeah.

 **Carolina Isfer** 1:38:38

So these are then the functionalities that we have identified in our navigation through the material. Is there anything else that you know we have not captured that we may have forgotten that popped up in the last year that is not? Part of that was not part of the RFP, so we don't know about.

 **Michael Lemke** 1:39:04

I can't think of anything on top of my head. Nimrod, what about you? You have anything?

 **Speaker 1** 1:39:11

No, I think this is a definitely a good start.

 **Michael Lemke** 1:39:14

We we anyway need to get confirmation when we start the project next year from the business owners to see whether this is actually everything but. From the look of it, it feels like you have captured the the the big ticket item, Sir.

 **Speaker 1** 1:39:34

I think, Michael, I think it'll definitely make sense for us to put this in front of the stakeholders from energy and storage, not just our own stakeholders, not just Anahed, but also.

 **Carolina Isfer** 1:39:35

Hello.

 **Michael Lemke** 1:39:44

No, not not. I'm talking about about talking about Megan and Stefanie's.

Speaker 1 1:39:50

Excellent. Then, yeah, then I think it's a good start and if we've missed anything, they'll be able to point it out to us quite quickly.

Clemens Lango 1:39:52

OK.

Carolina Isfer 1:39:56

Mhm.

Then in terms of other functionalities that are not, you know, just requirements that we see will be necessary apart from this particular needs from the units, we're going to have to get the search finished, so implement the search which we never did, but then.

There is also search applied to functional requirements, so we need to understand how results from the functional requires might show up in a search interface. So there's a new layer of search that we may not have considered, but we didn't have to consider.

Before and we need to look at at this point if we want to or not.

Michael Lemke 1:40:41

Yeah, question the the result should be displayed in the way it has been defined. The question is how do we get this information in covered by search, right? So it's rather a technical one the the the.

OK, good.

Mhm, mhm.

Carolina Isfer 1:41:02

Of the information that it exists, for example inside your FAQ, there is a search inside FAQ by itself. How is that displayed in the in the in the in a bigger scenario and and to be honest even.

Michael Lemke 1:41:07

Exactly.

This is this is what I understood. Yeah.

Carolina Isfer 1:41:18

The FAQ itself being a CMS inside a CMS, how much flexibility is there on the design of that to make that look like the rest? Because maybe there are limitations there.

By Tim.

So there is a an understand a serious understanding of search in in in relation to to this new scope then landing pages and micro sites so.

It is my understanding that we will not design landing pages to be all like the home page of SEFEL, you know that sort of format.

Michael Lemke 1:42:03

So what we are doing right now, so we have done a few landing pages already. We we are just using the CMS generating a URL like zipher dot EU RFP origination minus UK.

Carolina Isfer 1:42:19

Mhm.

Michael Lemke 1:42:19

Which is which is only visible if you have the link and we use the existing modules to build things like that. So we don't need anything particular at the moment, so we we can work with the.

Carolina Isfer 1:42:26

Yeah.

Michael Lemke 1:42:36

Means which we have and create pages. What would be?

Carolina Isfer 1:42:38

Mhm.

Benedikt Eger 1:42:40

And does that page then live under that new URL or is it just a redirect to some sub part of the of one of those pages?

Carolina Isfer 1:42:40

OK.

Michael Lemke 1:42:49

Pardon me?

Benedikt Eger 1:42:52

If you if you open the page, are you then the the URL that you just mentioned? Are you then redirected to saferenergy.co.uk or something like that? Or is it an actual page living under the domain with its own navigation structure and?

Michael Lemke 1:42:55

Yeah.

Benedikt Eger 1:43:12

No connection to the other sides.

Carolina Isfer 1:43:14

I think it's option B Benedict.

Michael Lemke 1:43:14

No, it I I show you. I show you. I show you. One second one. I show you.

Monika Morgenroth-Mohr 1:43:16

Oops, yeah. Perhaps I can give an example.

Benedikt Eger 1:43:17

Yeah.

Michael Lemke 1:43:35

So we had a request from. Yeah, we had a request from the business.

Carolina Isfer 1:43:38

I'll stop sharing my screen.

ML Michael Lemke 1:43:48

And right now it just lives within this navigation. You don't see it, it's nowhere, but it lives, it lives inside the website and for me it is not a problem at all. So we just use the.

Benedikt Eger 1:43:49

OK, yeah.

Yeah.

Carolina Isfer 1:43:58

Mm-hmm.

ML Michael Lemke 1:44:04

Different modules. We explained the roject boom, boom, boom how it works.

Benedikt Eger 1:44:10

Yeah, that's fine. That's fine. We'll be able to do it now.

Carolina Isfer 1:44:12

Mhm.

ML Michael Lemke 1:44:12

And so yeah, of course you're right. If you would do it in the proper, you would you would also do the the navigation here and there. But we are not that sophisticated with our landing pages and micro sites. It's it's not so necessary make it.

Benedikt Eger 1:44:31

Yeah.

ML Michael Lemke 1:44:32

Priority #2 Leave it there. Right now we can work with what we have. It's enough for us. Let's focus on making the functionalities for the business sites happening, yeah?

Benedikt Eger 1:44:37

Mhm.

Carolina Isfer 1:44:45

Mhm.

Michael Lemke 1:44:46

Does this make sense to everyone? Yeah.

Carolina Isfer 1:44:47

OK. Yes, it makes sense. So I'm just mindful that we have 10 minutes only left or 13 and I just want to cover the my last section here and we understand that there will be new modules and adapted modules. So that's a given. We just need to understand which ones and.

Benedikt Eger 1:44:47

Yeah, yeah.

Carolina Isfer 1:45:06

How much so that that's the bottom line and potentially we'll need an iframe module because there are certain things that leave that are referenced in, so we need to understand that as well.

I am not going to go through the system integrations, Michael, as you said, there are a lot of them. We need to go through each one and and and see which which role it plays in the whole scope and then how.

We bring them in or not, or abandon or substitute, etcetera. So that that's a navigation and a mapping in itself. Some things are easier, others not, others not so much, but that can be done later.

We have just a couple of open questions about.

About that, that would be good to get clarifications today. So we already addressed URLs, so hosting central hosting by UDG and URL sites are individual sites within for

a spirit as a project so.

It all sits together. Any other question in this topic, Benedicta, we may have?

Benedikt Eger 1:46:25

Not at the moment, but we will, we will get to that during the sometime in in January when we do a tech discovery and talk about those other system integration. This will come into play as well.

Carolina Isfer 1:46:37

We also then have a question. Maybe Mina will be able to answer that. How we're going to tackle analytics. It makes sense to to track the pages independently, but also interdependently.

With Botomo and NGA. So we need to make some decisions there about how that tracking is gonna happen.

We need to make sure that we have a clear process for testing and acceptance because we're going to be talking about multi functions and each one of those will have a different owner of.

Michael Lemke 1:47:17

We have two stakeholders. We have two stakeholders. One stakeholder is marketing.

Carolina Isfer 1:47:20

Mhm.

Michael Lemke 1:47:26

It's Megan Bryans and her team. She's responsible for the energy.

And she manages the other countries. So her organization, she's based in in the UK, but she is responsible for the whole marketing organization, also in France, the Netherlands, Germany.

Carolina Isfer 1:47:43

Mhm.

Mhm.

OK.

ML **Michael Lemke** 1:47:52

Yeah. And the other one is we call them the Stefanies. They are two ladies. Both of them are Stefanie, one with PH and one with an F They are the communication team of storage and.

Those are more or less the people who make the acceptance or their teams to make it simple. So there are not too many layers. This is our that that is our our point of attack. This is target group 0.

 **Carolina Isfer** 1:48:15

OK.

OK.

That's great. It makes it much easier.

OK. And so they may want to delegate internally, but then it's on them to to do that, OK.

ML **Michael Lemke** 1:48:32

Exactly. They consolidate, blah, blah, blah, blah, blah. They are the contacts.

 **Carolina Isfer** 1:48:36

All right. And and it's important that we we move through a planned test, user testing, acceptance, etcetera with them before we progress too far down. I don't want a repeat of homepage slash CEO approval scenario that's not allowed to happen again.

ML **Michael Lemke** 1:48:42

Mm-hmm, mm-hmm.

OK.

 **Carolina Isfer** 1:48:54

Michael, we talked earlier about the goal, the, the, the content migration and all of that is just my question is.

Simultaneous everything will be happening at 1:00 or they come in as they're ready each one of the sites.

ML **Michael Lemke** 1:49:15

We we target the simultaneous launch, so they have teams in the in the regions, right? And we we we need to see how we organise the rollout. The idea is to be simultaneously.

 **Carolina Isfer** 1:49:20

Mhm.

OK.

ML **Michael Lemke** 1:49:32

Because the pages they they have the same functionalities, they are, they are only so that there is 100% and each page has a different level of completion in regards to functionalities and products. Do do I make sense?

 **Carolina Isfer** 1:49:44

Mhm.

Mhm.

ML **Michael Lemke** 1:49:50

So all of them are 100% together, but UK maybe offers 90% of everything we have, Germany only 50 and so on. So they have different products, but in the end.

 **Carolina Isfer** 1:49:50

Yeah.

Mhm.

ML **Michael Lemke** 1:50:06

It's all the same, just you just say this one has this one, not this one has this instead, blah blah blah. It's mix and match.

 **Carolina Isfer** 1:50:13

Mhm.

Mhm.

 **Michael Lemke** 1:50:16

So it should work that we can do everything together.

 **Carolina Isfer** 1:50:19

OK, we may want to look at some efficiencies in the background Benedict in building this in the CMS so that there's content that can be replicated and translated that belongs to every every.

 **Michael Lemke** 1:50:33

Yeah, this parent and mother content concept would be nice to have this, huh?

 **Carolina Isfer** 1:50:36

Yeah, yeah. So stuff that is centralized, stuff that is localized, but then you would need to work with multi language translations to content that is centralized even though it's displayed.

 **Benedikt Eger** 1:50:38

Yeah.

OK.

 **Carolina Isfer** 1:50:51

In only French this way, German this way, etcetera. So there's there's a an interesting challenge there.

 **Benedikt Eger** 1:50:58

Yeah, but we can set up a a suggestion how?

 **Carolina Isfer** 1:50:59

To me.

No.

Mhm.

 **Michael Lemke** 1:51:06

So we have built something similar at TK Elevator as well, but we we had been an

organization with 100 websites, so that would make more sense. We only have five and thinking, yeah.

Carolina Isfer 1:51:10

Mhm.

But do you want to grow?

Michael Lemke 1:51:22

But but not but but more in in different areas where where it's easier where you don't need to make so much work happening. But in the end if we only think about the stage as shared content, it would be an overkill.

Carolina Isfer 1:51:30

Mhm.

Yes, correct. It needs to be worth it. OK, let's let's look into it because that.

Michael Lemke 1:51:38

To have this functionality of parent and mother thing is yeah, yeah, yeah.

Benedikt Eger 1:51:43

Yeah.

Michael Lemke 1:51:45

Nevertheless, take it down and discover with the marketing organization. I mean, most of the time central functions like to have this right, this power to make sure that things are consistent. But but let's see what I meant.

Carolina Isfer 1:51:55

OK.

Michael Lemke 1:52:05

To give you an example, some pages maybe have an FAQ, other pages are not. I'm not sure whether all the pages have FAQ or whether it's only one or two, right? They don't have this all right? And so this is what I meant. So all pages together show us 100%.

Carolina Isfer 1:52:11

Mhm. No.
Yeah.

Michael Lemke 1:52:22

Of scope, but not all individual pages will have 100 of the scope, yeah.

Carolina Isfer 1:52:27

Who use everything? OK.

No worries. Then for the last minute, please, if I get it, could get everybody's attention back here. I want to talk about just a road map. So this is where it becomes important to understand what what happens 1st and when.

We have, we are working with a target date of end of June, July, thereabouts, hopefully July, not June, but we'll see how fast we go and how well organized we can roll this out.

I cannot plan that far ahead without having the scope very clear, but for sure I can see what we want to be achieving in January and February. And so the scope for January would be to establish project governance, schedule all the workshops that we need.

So establish the relationships with storage and sales and continue refining the understanding of the scope. I'll then develop a preliminary project plan which in consultation with Chayo we will then.

They will develop their design implementation plan, so so they need to understand how they want to roll out the design and we will.

In parallel, marry that to how we're going to do the technical.

And we also want to go with them to the markets. So I say markets, but I mean the businesses and ask detailed, more detailed questions about this functionality so we can understand how.

They operate, and this is before we have the workshops. I don't imagine we're going to be able to hold workshops in January, all of them, you know, the second week of January. That might might be a bit of a stretch to make everybody available. We will try.

But for sure if we can get some meetings or questionnaire circulator or something so we start to understand the concepts earlier, that would be helpful so we can get to a

final scope document with clear boundaries by the end of January. Reason for that from UDG side.

We have a maximum budget allocation and we have to fit scope to this budget, not the other way around. Unless of course scope is necessary and then those conversations need to be need to be talked. But we need to really understand what is in and what is not.

And and delineate it. Once that is clear, we start with the kickoffs and we clarify then all the details. So hopefully early February or earlier if possible for Benedict, then we'll be leading those conversations with Union Rod and and any other.

Technical people you may want to involve and we will have then discovery workshops relating to system integrations, API, architecture, etc. So all of that from a technical side and in parallel we will have then business rules workshop, so understanding the.

Functionalities in the function. So how how is the logic? And this is where then it will be important that she participates because they will need to design to those functionalities and it's important that everybody really understands how they work, otherwise the whole thing doesn't.

Doesn't stand up. My idea is that once we had those workshops, we will then have functional and technical documentation that we'll put together and say, OK, this is the the outline of everything. We should look at developing small proof of concepts. For each of the the functionalities. So do some tests and get those approved before we go and and generate the whole thing and then do it really for for each function a bit of an agile iteration of each one of them. So it's important.

That design comes in parallel with with those or if not possible that we actually then test functionalities without design and then bring design back in. So we need to see how we can we can work with those but.

Important is that we don't go too far without having confirmation from the businesses that we we are achieving what the functionalities need to achieve. I mentioned before forms will be the first stuff that we want to work with and and search because I we already have enough information to get going there.

Without design contribution from Chao and we can get started so our team can can move that stuff ahead and as soon as design start to arrive we then can start with implementing front end.

Schemes to everything and then do the modules. So we'll be working with three development streams. So concept, functionality, concepts that we get sign offs on

structure, the forms and search and the modules and so all of that needs to be well. And truly in motion by the end of February. And so that's how I see it ahead of us. Any questions?

 **Michael Lemke** 1:58:01

There are no questions. I would like to add something. The topic is that that that we have a budget right and that we need to fit the scope to the budget. This is a very important item. It cannot happen.

 **Carolina Isfer** 1:58:05

Mhm.
Correct.

 **Michael Lemke** 1:58:17

That we open up the project like release one. This will not happen and so I like what you do in the beginning and I think even though that people always say the Germans like to over plan.

I think it is a good idea for us to be careful here and make sure that we understand things correctly.

Maybe we even sign topic, sign certain things with blood or so, because we don't have the time, the money, the resources to get derailed along the way. We really need to understand.

What drives the business? What do they need? I believe this is fairly simple.

Nevertheless, let's be very precise in the beginning, make sure that we.

 **Speaker 1** 1:59:13

The good thing is, Michael, that myself and and Carolina have a good, we have good communication these days on budget and a good understanding that we didn't have at the beginning. So we're all aware what the numbers are and we'll make sure that going into release 2.

 **Michael Lemke** 1:59:26

Right.

 **Speaker 1** 1:59:30

We we always check in with each other and we're very open and very transparent, which has made the last few months quite straightforward for for us when it came down to time sheets. So I I think we'll have an easier go with release too. But you're right, we we need to make sure we walk before we run.

And we we have to stay within the budget, but I I don't have any concerns like I did for release one.

 **Michael Lemke** 1:59:52

Yeah, and I'd rather spend a week or two weeks more in there and ask two or three more questions to be really precise and very clear rather than saying, oh, this is OK.

 **Carolina Isfer** 2:00:04

Mhm.

 **Michael Lemke** 2:00:10

Let's we'll figure it out.

 **Carolina Isfer** 2:00:13

I agree and you're clearly right in there and because we will be working with storage and sales, the involvement of the them as stakeholders is incredibly important. We have all been together for a whole year. We know how we work, we know.

The rhythms that we we use to collaborate, they don't and it's a good opportunity to dictate the pace, but I need to understand their availability, their commitment to all of this. So Michael, from your side internally to press it on on them.

The the Steffi's and the and the what was her name Megan that their direct involvement is is really important and if not that they really find somebody that they can delegate this that can be available as available as you were for for release 1.

 **Michael Lemke** 2:00:56

Megan.

 **Carolina Isfer** 2:01:11

Release one, you and me and work for for release one and and mean mode because otherwise we have no chance.

To to really meet what they need.

 **Michael Lemke** 2:01:21

Mhm.

 **Carolina Isfer** 2:01:26

All right, then we are over 4 minutes. I apologize for that. I I'd like to finish on time.
Not very German of me.

So I will send transcripts and document all of these. We've got a lot of good material here. I'll make it all available to you. Clemens and Martin, I did send you invitations for teams. Have you managed to?

 **Clemens Lango** 2:01:51

Yeah.

Yes.

 **Carolina Isfer** 2:01:54

Come in and see, yeah.

 **Clemens Lango** 2:01:54

P.

Yeah, we we saw those mentions in the Teams app. We did not go through yet. We didn't know.

 **Carolina Isfer** 2:02:01

Mhm.

But you but you're in.

 **Clemens Lango** 2:02:05

Yeah, I think we just have to click once, so at least it looked like that. Let me just do it. But yeah, it should be fine. Um.

 **Carolina Isfer** 2:02:11

Mhm.

Yeah, I want us to to to run this phase with with teams collaboration rather than e-mail exchanges like we've done before. We can we can certainly.

 **Clemens Lango** 2:02:22

Yeah, it makes totally sense with a short question then.

 **Carolina Isfer** 2:02:24

Come to the 20th century here and also I want to work with collaborative loop pages and loop components. I don't know if you're familiar with those, but we're going to be using that material as well. So there's there's a lot of changes that I want to put in to make sure that this project runs very smoothly because we're very. We we need to be very efficient here and I will send meeting invitations for the start of the year and start to put suggestions for workshop dates etcetera. What we need as soon as we're back in January.

 **Clemens Lango** 2:02:48

Yeah.

 **Carolina Isfer** 2:03:00

And then we use January for planning and active planning on this, so we can hit the ground in February, no fronts.
And I believe Jim will be joining us again from the end of January, so we'll have the full gang back.

 **Clemens Lango** 2:03:17

Excellent.

 **Carolina Isfer** 2:03:20

And that's it. Thank you all for your participation and attenders. I wish you all a Merry Christmas, a good break, and I'll see you in 2026.

 **Clemens Lango** 2:03:21

Mm.

 **Speaker 1** 2:03:30

See you all then.

Clemens Lango 2:03:31

See you. Have a nice Christmas time. Bye, bye.

Speaker 1 2:03:31

Thank you. Bye.

All the best.

Carolina Isfer 2:03:32

Thank you. Bye, bye.

Benedikt Eger 2:03:35

Hi.

Carolina Isfer stopped transcription
